People usually think blood looks all the same; all is red. But scientists divide it into four types: A, B, AB and O. Let's look at the different types of blood.

People with type A

They look quiet from the outside. But they ask so much of themselves that they may be nervous inside. They get happy or sad easily. They look shy; in fact, they are very careful. They can have their friends trust them easily, they think what Type A people do and say are usually right.

People with type B

They have strong minds. Once they start doing something, they don't give up easily. They will try their best to finish it and do it well. They always try to make themselves different from others. They want to do things in their own way.

People with type AB

Of all blood types, they may be the most special and strangest. They can be open and shy, noisy and quiet at the same time. They are always ready to help others.

People with type O

They are open and good at making friends. They always start doing something but don't always finish it. They have lots of new ideas and love to be noticed by others. They strongly believe in themselves.

(素養題)

Today, the total world population has more than 7 billion. By 2050, the world population will probably grow to 10 billion. One of problems that the quick growing of population brings is "pollution." Look at the **chart 1**. It shows the growing of the total world population from 1700 to 2100.

Along with the growing population come more factories, more cars, more coal-fired power plants, and more wastes especially the plastic productions. Factories and cars lead to air pollution. When plastic is burned, the dirty air hurts people's health. If factories let waste water flow into lakes, rivers and seas, it will become water pollution. Then people won't have clean drinking water year by year. Look at the **chart 2**. It tells us how of the total number of plastic is growing in the world from 1950 to 2050.
